ABSTRACT

Solvent extraction experiments of Ca\textsuperscript{2+} with D2EHPA and 15\% saponified D2EHPA from cation-exchange resin regeneration wastewater have been performed. Compared with the extraction efficiency (E) of Ca\textsuperscript{2+} with D2EHPA, the use of 15\% saponified D2EHPA significantly increases the extraction efficiency (E) of Ca\textsuperscript{2+}. In this work, a systematic study on the extraction of Ca\textsuperscript{2+} from cation-exchange resin regeneration wastewater using saponified D2EHPA has been carried out. To study the extraction efficiency and advantages of the method in the removal of Ca\textsuperscript{2+}, various parameters such as saponification ratio of D2EHPA, D2EHPA mass fraction, reaction temperature, phase mass ratio, initial pH of wastewater, transfer-speed, and transfer-time are studied and optimized. The results show that Ca\textsuperscript{2+} in wastewater can be effectively removed by saponified D2EHPA. An extraction efficiency of more than 99.9\% is attained at the optimized parameters and the cation-exchange resin regeneration waste-water can be discharged directly by two levels of extraction, and it meets the Chinese National Emission Standards.
